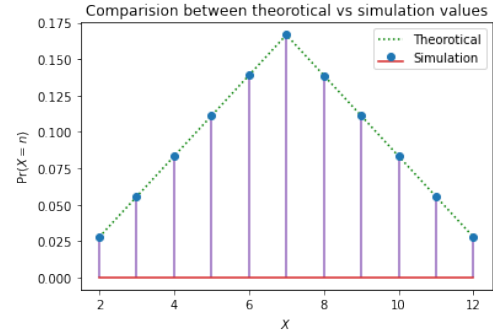

Fig. 0: Probability as a function of n

## 1 PROBLEM

Let a pair of dice be thrown and the random variable  $X$  be the sum of the numbers that appear on the two dice. Find the mean or expectation of  $X$ .

For mean

$$\bar{X} = \sum_n n \times \Pr(X = n) \quad (2.0.5)$$

$$\bar{X} = 7 \quad (2.0.6)$$

## 2 SOLUTION

Let  $X_1, X_2 \in \{1, 2, 3, 4, 5, 6\}$  be two random variables associated with event.

$X = X_1 + X_2$ , representing sum of outcomes of two dices.

$$\therefore X \in \{2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12\}$$

Now

$$\Pr(X = n) = \Pr(X_1 + X_2 = n) \quad (2.0.1)$$

$$= \Pr(X_1 = k, X_2 = n - k) \quad (2.0.2)$$

$$= \sum_k \Pr(X_1 = k) \times \Pr(X_2 = n - k) \quad (2.0.3)$$

$$P_X(n) = \begin{cases} 0 & n < 2 \\ \frac{n-1}{36} & 2 \leq n \leq 7 \\ \frac{13-n}{36} & 7 < n \leq 12 \\ 0 & 12 < n \end{cases} \quad (2.0.4)$$

n	2	3	4	5	6	7	8	9	10	11	12
Pr(X = n)	$\frac{1}{36}$	$\frac{2}{36}$	$\frac{3}{36}$	$\frac{4}{36}$	$\frac{5}{36}$	$\frac{6}{36}$	$\frac{5}{36}$	$\frac{4}{36}$	$\frac{3}{36}$	$\frac{2}{36}$	$\frac{1}{36}$

TABLE 0: Probability as a function of n

by substituting values from table 0

$\therefore$  expectation value of  $X$  is 7
